Overview of DevOps

Traditional Way

Traditional Way

Life Without DevOps

What Drives the Need for DevOps?

Lack of Automated and Secured Workflow Management Systems in Business organization

**Impact on business
due to challenges
& Problems**

Ineffective utilisation
of resources

Misuse of
working capital

Increased in
time-to-market

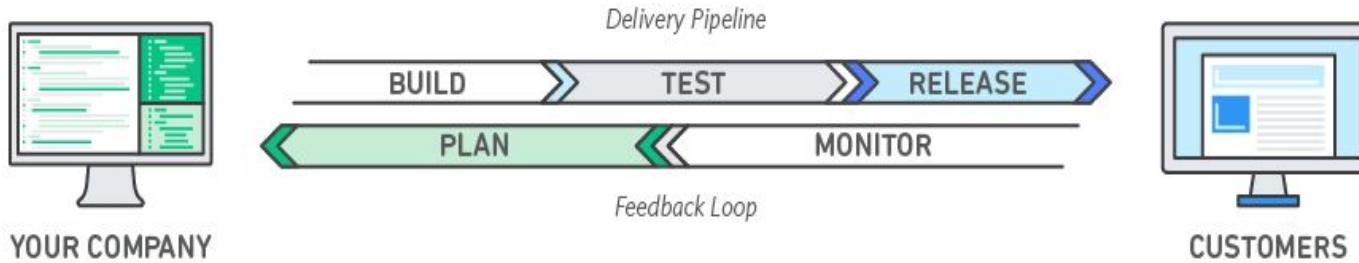

Laboursome
process

Introduction to DevOps

What Is DevOps?

- DevOps is a combination of cultural philosophies, practices and tools that increase an organization's ability to deliver applications and services at high velocity; evolving and improving products at a faster pace than organizations that use traditional software development and infrastructure management processes.
- It combines software development (Dev) and information-technology operations (Ops) that results in shortening the systems development life cycle and providing continuous delivery with high software quality and exceptional performance.
- In order for DevOps to impact businesses, it needs to be embraced and adopted by everyone responsible.

CALMS Framework

CALMS is a framework that assesses a company's ability to adopt DevOps processes, as well as a way of measuring success during a DevOps transformation

Culture

Automation

Lean

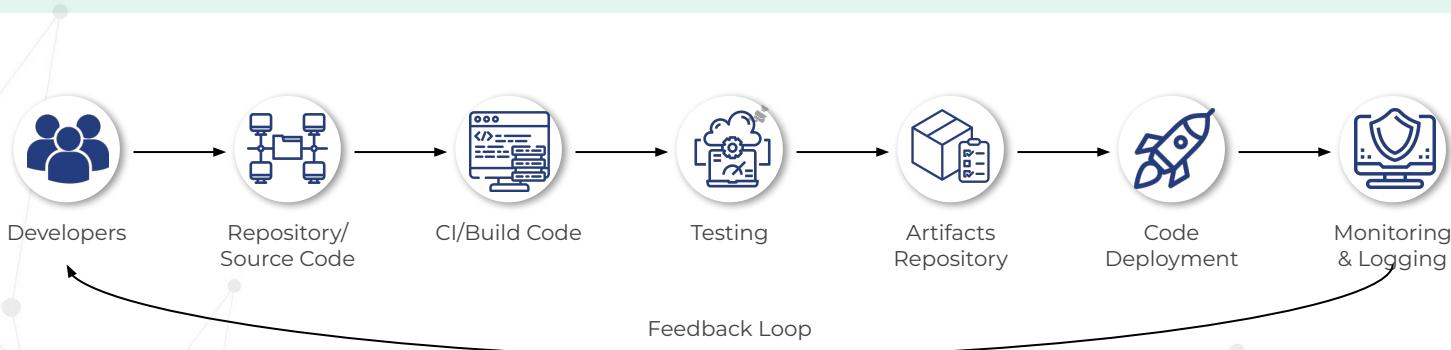

Measurement

Sharing

Introduction to DevOps

The DevOps Process

Impact of DevOps

High Speed Operations

Rapid Delivery

Increased Reliability

High Scalability

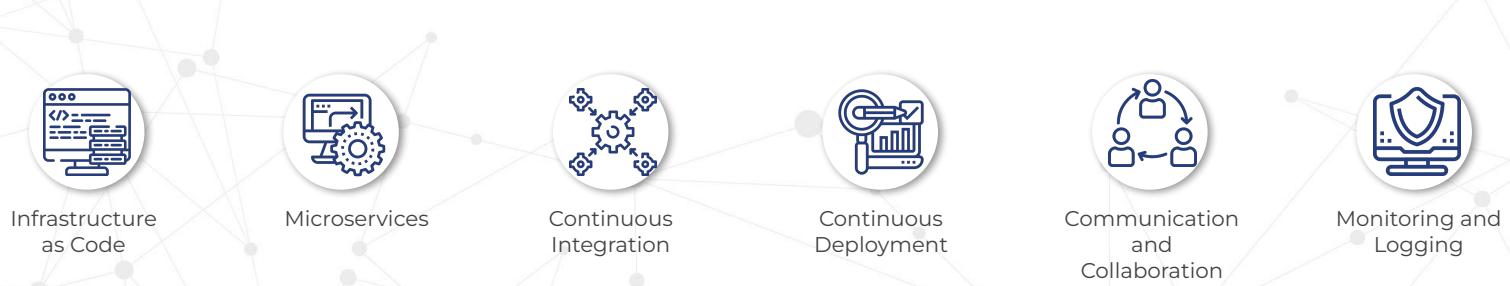

Enhanced Security

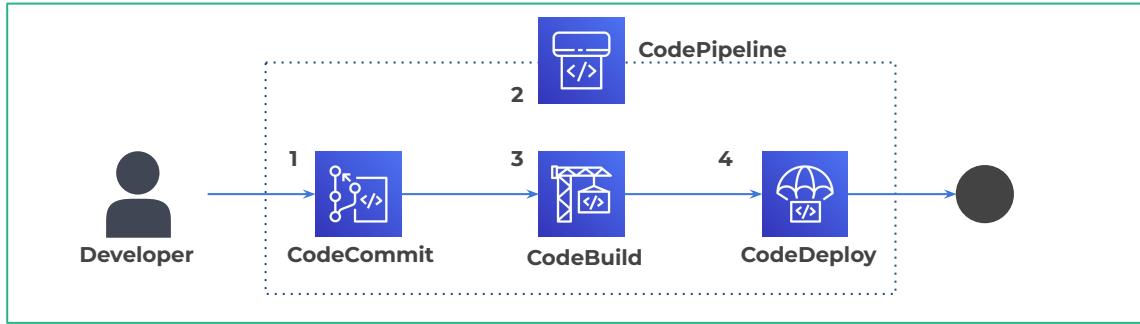

Better Collaboration

DevOps Practices

DevOps Cycle

Process:

1. The Developer pushes the changes to the repository in CodeCommit and the flow is triggered
2. CodePipeline listens to push event and gets the source code. It launches CodeBuild
3. CodeBuild builds the code and pushes it to CodeDeploy.
4. CodeDeploy deploys the application code in to a designated destination

Other AWS Services Used for DevOps

 **Amazon EC2**
Virtual Servers to deploy Code

 **Amazon ECS**
Container Management Service

 **Amazon Lambda**
Runs code without managing servers

 **Amazon CloudFormation**
Manage a collection of related AWS services

 **Amazon OpsWorks**
To configure and operate applications

 **Amazon Config**
AWS configuration history and change notifications

AWS DevOps Services

Devops Technology Stack

**CONTINUOUS

AWS Elastic
Container Service

Amazon ECS for
Kubernetes

AWS Fargate

AWS DevOps Services

CONTINUOUS INTEGRATION & CONTINUOUS DELIVERY

AWS
CodeCommit

AWS
CodeBuild

AWS
CodePipeline

Amazon CodeCommit

Securely host highly scalable private Git repositories. Collaborate on code.

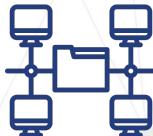

AWS CodeCommit Features

Encryption

Access Control
using IAM

Unlimited Repositories

Easy Access and
Integration

Notifications and
Custom Scripts

AWS CodeCommit Benefits

Fully managed

Secure

High Availability and
Durability

Collaborate on code

Faster development
lifecycle

Use your existing tools

AWS CodeBuild

Build and test code with continuous scaling

Source Code

AWS CodeBuild

Continuous integration and delivery workflows

Build and test your code

- Preconfigured build environments
- Customize build environments

Security Monitoring and permissions

- Set granular controls over access
 - Monitoring and Alerts

Configurable settings

- Specify build commands
- Select compute type
- Choose source integrations

Key Benefits

Fully managed build service

AWS CodeBuild eliminates the need to set up, patch, update, and manage your own build servers and software

Continuous scaling

AWS CodeBuild scales up and down automatically to meet your build volume

Pay as you go

With AWS CodeBuild, you are charged based on the number of minutes it takes to complete your build

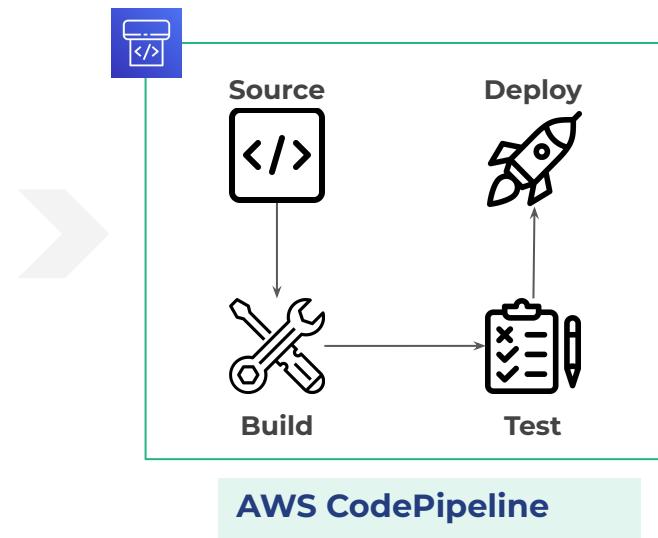

Extensible

You can bring your own build tools and programming runtimes to use with AWS CodeBuild

AWS CodePipeline

Automate continuous delivery pipelines for fast and reliable updates

Key Benefits

Serverless Architecture - Zero administration

With AWS CodePipeline, you can immediately begin to model your software release process. There are no servers to provision or set up

Rapid delivery

AWS CodePipeline automates your software release process, allowing you to rapidly release new features to your users

Configurable workflow

AWS CodePipeline allows you to model the different stages of your software release process

Easy to integrate

AWS CodePipeline can easily be extended to adapt to your specific needs. You can use pre-built plugins or your own custom plugins in any step of your release process

AWS DevOps Services

INFRASTRUCTURE & AUTOMATION

AWS
CloudFormation

AWS
CodeDeploy

AWS CloudFormation

Model and provision all your cloud infrastructure resources

Cloud Infrastructure
Resources

AWS CloudFormation

Management

- Cross account & cross-region management
- Dependency management
- Preview changes to your environment
- Automates the provisioning and updating of your infrastructure in a safe and controlled manner

Extensibility

- Model, provision, and manage third party application resources
- Familiarity with programming languages
- Authoring with JSON/YAML

Key Benefits

Model it all

AWS CloudFormation allows you to model your entire infrastructure and application resources with either a text file or programming languages

Automate & deploy

AWS CloudFormation provisions your application resources in a safe, repeatable manner, allowing you to build and rebuild your infrastructure and applications, without having to perform manual actions

Codification

You can author infrastructure with any code editor, check it into a version control system, and review the files with team members before deploying into production.

Why use AWS CloudFormation?

Support for Different Resources:

AWS CF assists a smorgasbord of resources, which lets you make a highly reliable, available, and scalable or upgradeable AWS infrastructure to cater to your specific application requirements.

Easy to use:

With CloudFormation, it's easy to classify and station a suite of the secure platform's resources. It allows you to describe any contingencies or special yardsticks to pass in during runtime. You may employ any of the several CloudFormation sample templates verbatim or as a beginning point.

Flexible and Declarative:

To erect the infrastructure you require, you list out the platform's resources, interconnections, and configuration values you want the template to have and then permit CloudFormation to take care of the rest with some basic clicks in the console

Customization through parameters:

You may use parameters for customizing specific template aspects at run time. For instance, you could pass the Amazon EC2 instance types, Amazon EBS volume size, RDS database size, server port numbers, and database to the platform when creating a stack.

Drag and drop UI to visualize and edit:

AWS CloudFormation Designer offers a template diagram with icons denoting the Amazon platform's resources and arrow signs indicating relationships. You could create and modify templates using the interface and then alter template details with the help of the inbuilt JSON text editor.

How AWS CloudFormation work?

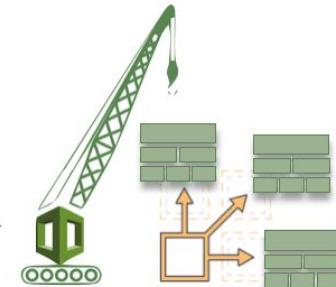

Code your infrastructure from scratch with the CloudFormation template language, in either YAML or JSON format, or start from many available sample templates

Check out your template code locally, or upload it into an S3 bucket

Use AWS CloudFormation via the browser console, command line tools or APIs to create a stack based on your template code

AWS CloudFormation provisions and configures the stacks and resources you specified on your template

Templates

- A template in AWS CloudFormation is a formatted text file in JSON or YAML language that describes your AWS infrastructure
- To create, view and modify templates you can use AWS CloudFormation Designer or any text editor tool
- Templates in AWS CloudFormation consists of 9 main objects

Format
version

Description

Metadata

Parameters

Mappings

Conditions

Resources

Outputs

Template Structure

```
{  
    "AWSTemplateFormatVersion" : "version date",  
  
    "Description" : "JSON string",  
  
    "Metadata" : {  
        template metadata  
    },  
  
    "Parameters" : {  
        set of parameters  
    },  
  
    "Mappings" : {  
        set of mappings  
    },  
  
    "Conditions" : {  
        set of conditions  
    },  
  
    "Transform" : {  
        set of transforms  
    },  
  
    "Resources" : {  
        set of resources  
    },  
  
    "Outputs" : {  
        set of outputs  
    }  
}
```

JSON

```
---  
AWSTemplateFormatVersion: "version date"  
  
Description:  
    String  
  
Metadata:  
    template metadata  
  
Parameters:  
    set of parameters  
  
Mappings:  
    set of mappings  
  
Conditions:  
    set of conditions  
  
Transform:  
    set of transforms  
  
Resources:  
    set of resources  
  
Outputs:  
    set of outputs
```

YAML

Template Structure

```
1 AWSTemplateFormatVersion: 2010-09-09
2 Description: >>
3 Launch an EC2 Instance running apache and expose
4 default page to the internet. Hardcoded to work
5 only with US-EAST-1 (N. Virginia)
6 Parameters:
7   InstanceType:
8     Description: WebServer EC2 instance type
9     Type: String
10    Default: t2.micro
11    AllowedValues:
12      - t2.nano
13      - t2.micro
14 Resources:
15   WebServer:
16     Type: 'AWS::EC2::Instance'
17     Properties:
18       Tags:
19         - Key: Name
20           Value: Apache Default WebServer
21     InstanceType: !Ref InstanceType
22     # You shouldn't hardcode, just show where for example
23     ImageId: 'ami-0b898840883858657'
24     SecurityGroupIds:
25       - !GetAtt SecurityGroup.GroupId
26     UserData:
27       Fn::Base64:
28         !Sub |
29           #!/usr/bin/env bash
30           su ec2-user
31           sudo yum install httpd -y
32           sudo service httpd start
33     SecurityGroup:
34       Type: 'AWS::EC2::SecurityGroup'
35       Properties:
36         GroupDescription: Enable internet users to access.
37         SecurityGroupIngress:
38           - IpProtocol: tcp
39             FromPort: 80
40             ToPort: 80
41             CidrIp: 0.0.0.0/0
42     Outputs:
43       PublicIp:
44         Value: !GetAtt WebServer.PublicIp
45
```

Template Sections

MetaData Additional information about the template

Description A description of what this template is suppose to do

Parameters Values to pass to your template at runtime

Mappings A lookup table. Maps keys to values so you change your values to something else

Conditions Whether resources are created or properties are assigned

Transform Applies macros (like applying a mod which change the anatomy to be custom)

Resources* A resource you want to create eg. IAM Role, EC2 Instance, Lambda, RDS

Outputs Values that returned eg. an ip-address of new server created.

CloudFormation Templates **requires** you to **at least list one resource**.

AWS CodeDeploy

Automate code deployments to maintain application uptime

Software and Applications

AWS CodeDeploy

Key Benefits

Centralized control

AWS CodeDeploy allows you to easily launch and track the status of your application deployments through the AWS Management Console or the AWS CLI

Automated deployments

AWS CodeDeploy fully automates your software deployments, allowing you to deploy reliably and rapidly

Minimize downtime

AWS CodeDeploy helps maximize your application availability during the software deployment process

Easy to adopt

AWS CodeDeploy is platform and language agnostic and works with any application

Control

- Monitoring and control
- Deployment groups
- Deployment history
- Review defined events

Instance deployments

- Repeatable deployments
- Automatic scaling
- On-premises deployments

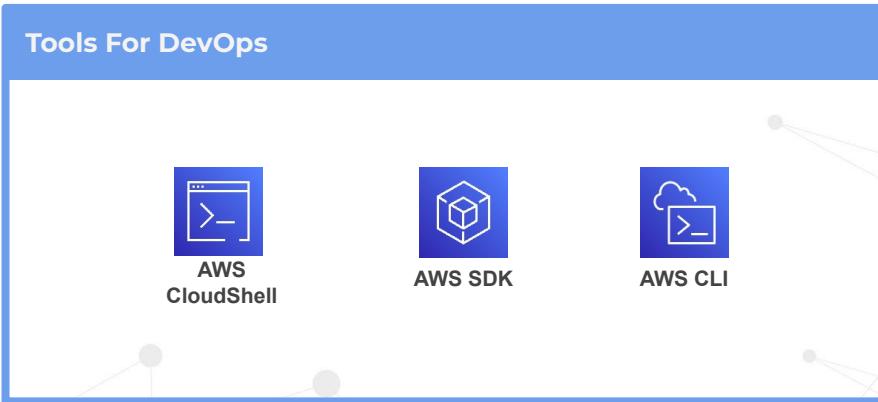

Easy to adopt

- Language and architecture agnostic
- Tool chain integration

Updates, Tracking and Rollback

- Rolling and Blue/Green updates
- Deployment health tracking
- Stop and rollback

AWS DevOps Services

AWS SDK Overview

Highly secure, reliable, and scalable way to run containers

SDKs

SDKs take the complexity out of coding by providing language-specific APIs for AWS services

JavaScript

Python

PHP

.NET

Ruby

Java

Go

Node.js

C++

AWS SDK Example

Highly secure, reliable, and scalable way to run containers

```
pip install boto3
```

```
import boto3
```

```
# Let's use Amazon S3  
s3 = boto3.resource('s3')
```

```
# Print out bucket names  
for bucket in s3.buckets.all():  
    print(bucket.name)
```

Steps:

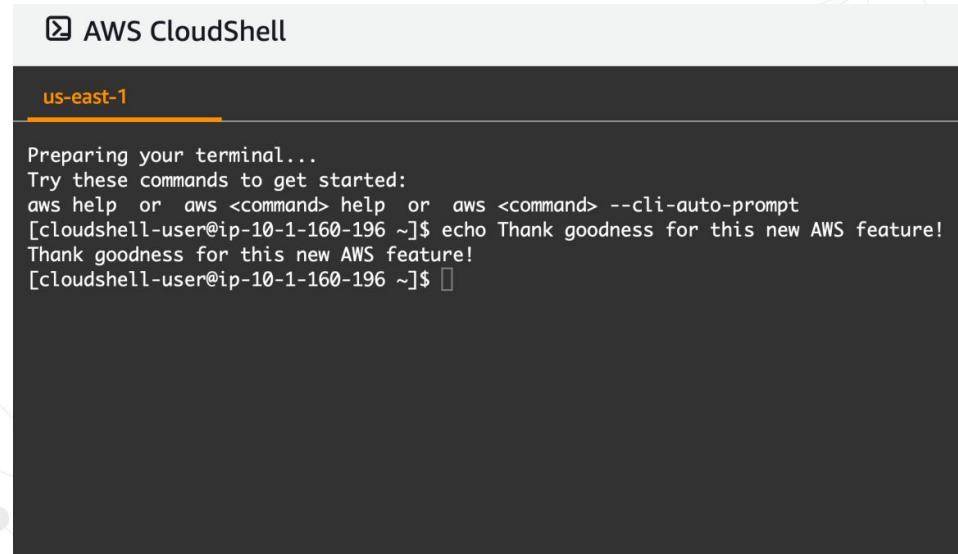

1. Install boto3
2. Import and indicate which service to use
3. Use the object to create/configure.

[Boto3 Api Reference](#)

AWS Cloudshell Overview

Common development and operations tools right from your browser and at no additional cost

- AWS CloudShell is a browser-based shell that makes it easy to securely manage, explore, and interact with your AWS resources.
- CloudShell is pre-authenticated with console credentials
- Common development and operations tools are pre-installed, so no local installation or configuration is required.

The screenshot shows a terminal window titled "AWS CloudShell" with the region "us-east-1" selected. The terminal displays a welcome message: "Preparing your terminal... Try these commands to get started: aws help or aws <command> help or aws <command> --cli-auto-prompt". It then shows a command being run: "[cloudshell-user@ip-10-1-160-196 ~]\$ echo Thank goodness for this new AWS feature! Thank goodness for this new AWS feature! [cloudshell-user@ip-10-1-160-196 ~]\$ ". The background of the slide features a network graph pattern.

AWS CLI Overview

unified tool to manage your AWS services

- AWS CLI is a unified tool to manage your AWS services.
- We can control multiple AWS services from the command line and automate them through scripts.

Command Line Tools

Control your AWS services from the command line and automate service management with scripts

AWS CLI

PowerShell Tools

Amazon EC2 AMI Tools

AWS Elastic Beanstalk CLI

Amazon ECS CLI

AWS Amplify CLI

AWS Serverless Application Model (SAM)
CLI

AWS Copilot

AWS CLI Example

Highly secure, reliable, and scalable way to run containers

```
$ curl "https://awscli.amazonaws.com/awscli-exe-linux-x86_64.zip" -o "awscliv2.zip"  
unzip awscliv2.zip  
sudo ./aws/install
```

```
$ aws --version  
aws-cli/2.4.5 Python/3.8.8
```

```
$ aws s3 ls s3://mybucket  
LastWriteTime  
-----  
2013-09-03 10:00:00  
Length Name  
-----  
PRE myfolder/  
1234 myfile.txt
```

Steps:

1. Install aws cli
2. Check the installation (using aws --version)
3. Run aws cli commands

[AWS CLI Reference](#)

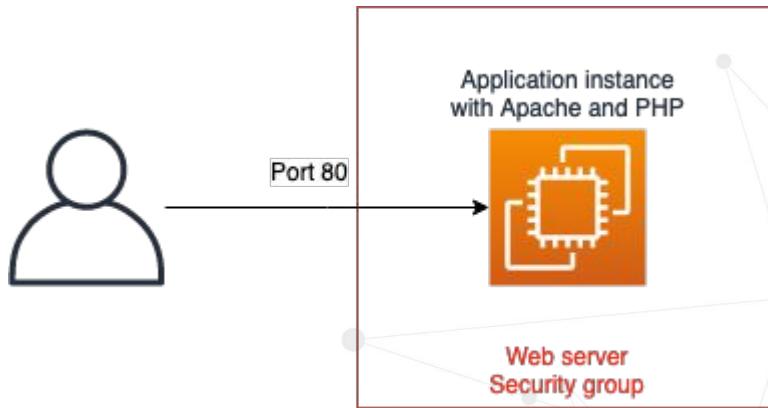

DEMO

Demo

- In this lab you will deploy an Apache Web server with a simple PHP application via UserData property.
 - First, you will bootstrap EC2 instance to install web server and content.
 - Then you will create an EC2 Security Group and allow access on port 80 to the instance.
 - Finally, you will view the content served by the web server.

The following diagram provides a high-level overview of the architecture you will implement.

A network graph consisting of numerous small, semi-transparent gray circular nodes scattered across the frame. These nodes are interconnected by a web of thin, light-gray lines, creating a sense of a complex, distributed system or community.

THANK YOU
